

Protect Your New Mattress or Salvage Your Old One - Ask us How...

Save your old mattress or protect your new one with bed bug proof encasements specifically for use with bed bugs. Ask your Pest Management Professional for more information!

Protect your family from **BED BUGS.**

Currently the only mattress and box spring encasement with independent lab testing overseen by a leading bed bug entomologist. Coated on all four-sides with poly-urethane, bed bugs cannot bite through or escape. To be used as part of a comprehensive bed bug management program.

Protect-A-Bed® encasements are designed to make your bed more comfortable while creating a hygienic, allergy free sleep zone. Additional features include:

- Offers protection for new mattresses and box springs and the ability to salvage already infested ones.
- Gap-free stitching and an enforced zipper traps bugs and their eggs inside.
- Poly-urethane coating on all four sides prevents bed bugs from biting through.

Frequently Asked Questions:

Why should I encase my mattress and box spring?

By encasing an already infested mattress and box spring you are trapping any bed bugs and eggs that our control effort may have missed or ones that may be hiding in the complex construction of the box spring. The encasement is bite-proof and the bed bugs cannot escape from it. Therefore, you can salvage your infested mattress and box spring and protect yourself by using our encasements. If you choose to discard your mattress and purchase a new one it is equally important to encase it so that it does not become infested with any bed bugs that may remain in the room.

Will the encasement alone solve my bed bug problem?

No, the encasement should be used as part of a comprehensive bed bug treatment program to eliminate your home or hotel of bed bugs. If not treated properly, the bed bugs will simply re-infest the bed living on top of the encasement or other areas in your bedroom.

Why should I purchase my mattress encasement and box spring through my pest management professional and not at a department store?

Our encasements have gone through extensive lab testing overseen by a leading bed bug entomologist, Richard Cooper. At this time, there are no other encasements lab tested to be bed bug bite proof and escapable proof. Our encasements have been designed specifically for use with bed bugs. The zipper teeth are the correct size to ensure that bed bugs cannot escape through them. The stop has been reinforced so there is no gap where the material meets the close of the zipper. And the stitching is tight enough to prevent escape by bed bugs.

When should I launder the encasements?

You should leave the encasements on the mattress and box spring for at least one year after the bed bugs have been eliminated. When you do launder it be sure it is dried at a temperature of at least 140 degrees to kill any remaining live bed bugs, nymphs or eggs.

Can I keep my old mattress and box spring which was infested with bed bugs?

Yes, you can keep your old mattress and box spring if you use our encasements. Prior to putting on the encasements we will treat the mattress and box spring and then encase it. Any bugs and eggs that may still be present in the mattress and box spring become trapped within the confines of the encasement, where they will eventually die from starvation. It is important that you leave the encasements in place for one year without laundering them so that any remaining bed bugs and eggs stay trapped.

Is the encasement material breathable?

Yes, our encasement is poly-urethane coated so that bed bugs cannot bite through it. The material is, however, breathable.

Will the mattress encasement make my bed uncomfortable to sleep on?

No, our mattress encasement is made of very soft material which has actually been reported to make our clients beds more comfortable. The poly-urethane coating is covered with this soft material which eliminates any noise or discomfort that you would expect from typical vinyl or plastic encasements.
